

Sprint 2 Report - VoiceToText - EK Health - February 22, 2016

Actions to stop doing:

- The team should stop updating Trello board towards the end of the sprint. Instead, update the boards after scrum meetings so that there is time to discuss how much work is accomplished, what tasks are left to do, and build a work schedule for the next couple of days. This would make the team more productive and stay on task.
- The team needs to stop thinking ahead and trying to implement future implementations without having a stable version that is acceptable by the product owner. It is important to follow Agile methodologies and implement iteratively in order to have basic functionality by the end of the release.

Actions to start doing:

- The team needs to start looking up online resources and documentation on how to implement RESTful services for iOS and Android. We will be implementing a basic mobile UI of the EK web service. Therefore, we will need to understand the HTTP/HTTPS methods and the error codes listed on this website.
<http://www.restapitutorial.com/lessons/httpmethods.html>.
- The teams needs to start updating the product owner more frequently on the progress of the application. As we are coming to the end of the quarter it is important that our product owner is satisfied with the end application and its core functions.

Actions to keep doing:

- The team should continue to improve our understanding of mobile development process and best practices. Especially in learning the ins and outs of Android Studio (Java) and Xcode (Swift) in order to speed up the development process.

- The team should continue to pair program as it not only lowers our error rate and improves speed of development, it also serves as a teaching tools for teammates that are not as experienced in a development environment as others.

Work Completed/Not Completed:

List of user stories that were completed:

- Network Status - As developers, we need to check when network is on or off.
- Offline network - As developers, understand the sphinx API for offline usage.
- Google Speech implementation - Implement Google Speech when network is available.
- Android Studio environment - As developers, we need to understand Android Studio and its basic functionality.
- Xcode (iOS) Environment - As developers, we need to implement OpenEars (an iOS version of PocketSphinx) in an iPhone application
- User Interface - As a user, I need an option to start speech recognition so that my spoken words are transcribed into text after speaking into the microphone.
- Hashing Dictionary of Words - As developers, we need to create a key-value pairs of words spoken so that there is a faster lookup of the same word if the user speaks that word.

List of user stories that were not completed:

- As developers we need to find out how to train sphinx.
 - Just didn't actually train it more than $\frac{2}{3}$ of this story was done

Work Completed Rate: We completed about 65 out the 70 ideal hours. The team was able to complete 7 user stories out the 8 planned for sprint 2. The

Burn Up Chart - Sprint 2

The chart displays the progress of a sprint. The Y-axis represents 'Ideal Hours' from 0 to 80. The X-axis represents 'Dates' from 1/27/2016 to 2/16/2016. A horizontal blue line at 70 represents the total 'Story Points'. A red line represents 'Our Progress'. The progress starts at approximately 5 hours, increases to 20 hours by 2/4/2016, remains flat until 2/12/2016, and then increases sharply to approximately 65 hours by 2/16/2016.

Date	Story Points (Ideal)	Our Progress (Actual)
1/27/2016	70	5
1/31/2016	70	10
2/4/2016	70	20
2/8/2016	70	20
2/12/2016	70	20
2/16/2016	70	65
